

# Introduction To TensorFlow and Sentiment Analysis

## References

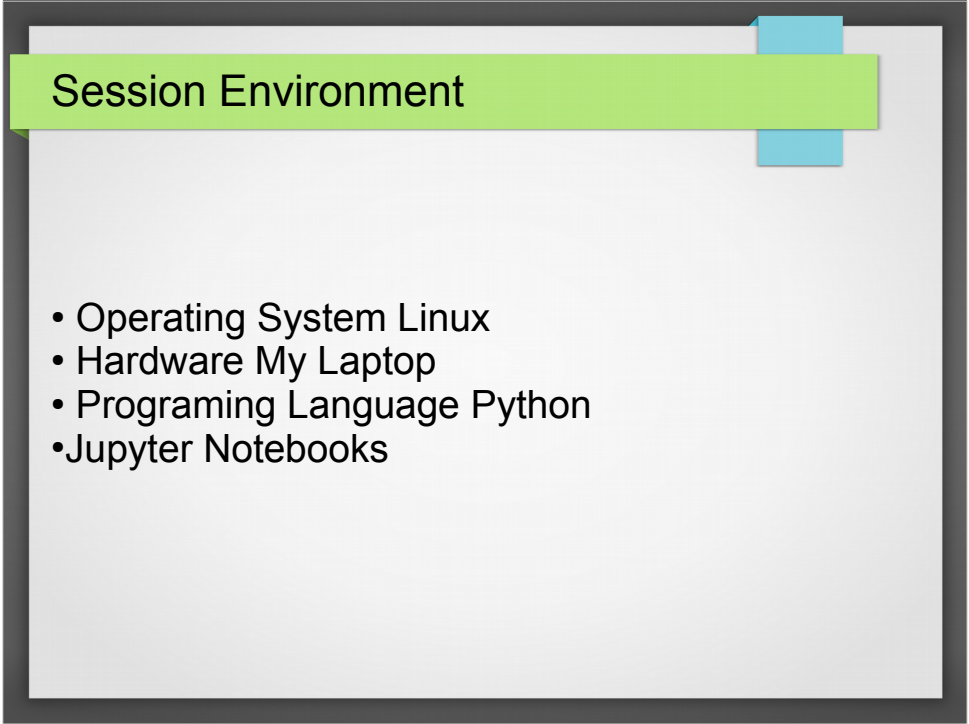

- The examples used during the introductions were extracted from the following reference:
  - O'Reilly Learning TensorFlow - Tom Hope, Yehezkel S. Resheff & Itay Lieder -
  - Fundamentals of Machine Learning for Predictive Data Analytics: Algorithms, Worked Examples, and Case Studies (MIT Press) - John D. Kelleher, Mac Namee, Brian, Aoife D'Arcy -
  - Udacity Artificial Intelligence Nanodegree.
  - Deep Learning Ian Goodfellow, Yoshu Bengio and Aaron Courville.

## Content

- Introduction to TensorFlow
- Natural Language Processing IMDB reviews sentiment analysis

## Agenda

- What is a Tensor?
- What is a Graph Theory?
- What is TensorFlow?
- Installing TensorFlow
- TensorFlow and Graph Theory Relation
- TensorFlow Language Objects
- TensorFlow and NN Model Hidden Layers
- Linear regression and Logistic Regression
- Natural Language Processing and Tensorflow

The image shows a presentation slide with a light gray background and a dark gray border. At the top, there is a green rectangular header with the text 'Session Environment'. Below the header, there is a bulleted list of four items. The slide is decorated with two blue rectangular tabs on the right side.

## Session Environment

- Operating System Linux
- Hardware My Laptop
- Programming Language Python
- Jupyter Notebooks

Python was the first client language supported by TensorFlow and currently supports the most features. More and more of that functionality is being moved into the core of TensorFlow (implemented in C++) and exposed via a C API. Client languages should use the language's foreign function interface (FFI) to call into this C API to provide TensorFlow functionality.

## What is a Tensor?

- Tensor: a multidimensional array, and extension of two-dimensional tables (matrices) to represent data with higher dimensionality.
- Vectors Matrices and their relation with Tensors.

Let us see how these three types of data representation look in Tensorflow

- Activate conda tensorflow environment.  
\$>source activate tensorflow
- Run ipython  
\$>ipython

Vector

```
In [22]: import numpy as np
In [23]: vector = np.array([1,2,3,4,5,6])
In [23]: vector.shape
In [25]: vector.reshape(6,1))
```

Matrix

```
In [27]: matrix = np.array([[1,2,3],[4,5,6]])
In [29]: matrix.shape
In [28]: matrix
```

Tensor

```
import matplotlib.pyplot as plt
import matplotlib.image as mpimg
img = mpimg.imread('image/rpo.png')
imgplot = plt.imshow(img)
plt.show()
img.shape
```

Just one matrix of the three

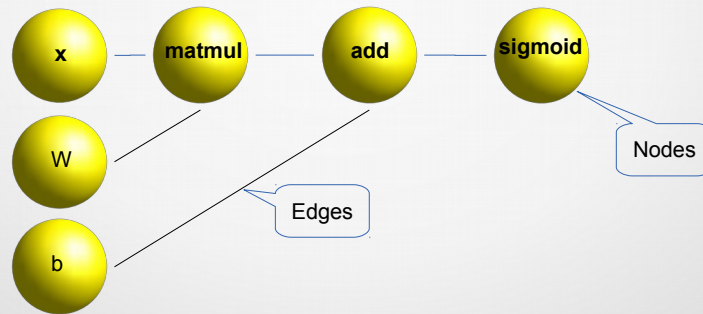

```
img[0,:,0].shape
```

Tensor 2

```
np.array([[[[1.1],[1.2],[1.3]],[[2.1],[2.2],[2.3]],[[3.1],[3.2],[3.3]]]])
```

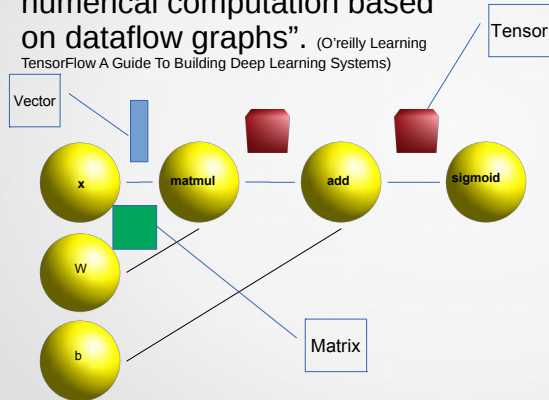

## What is a Graph?

“...mathematical structures used to model pairwise relations between objects. A graph in this context is made up of **vertices**, nodes, or points which are connected by edges, arcs, or lines. A graph may be undirected, meaning that there is no distinction between the two vertices associated with each edge, or its edges may be **directed** from one vertex to another...” ([https://en.wikipedia.org/wiki/Graph\\_theory](https://en.wikipedia.org/wiki/Graph_theory))

# What is TensorFlow?

“Is a software framework for numerical computation based on dataflow graphs”. (O’reilly Learning TensorFlow A Guide To Building Deep Learning Systems)

- Graph
- Operations:
  - Source
  - Mathematic
- Namespaces
- Sessions

## Installing TensorFlow

- Miniconda (<https://conda.io/miniconda.html>)
- Create python environment
- Add the packages:
  - Jupyter
  - Pandas
  - Numpy
  - Matplotlib
  - Tensorflow
  - Tensorflow-gpu

### 1) Create container:

```
$>sudo docker run --rm -v  
/home/gaure/Google_Drive/Tensorflow_Course/co  
nda:/conda -it centos:latest /bin/bash
```

### 2)After creating the container and before installing Miniconda install bzip2

```
$>yum -y install bzip2
```

### 3) Reload the bash profile

```
$>. ~/.bashrc
```

### 4) Create environment:

```
$>conda create -n tensorflow python=3.6
```

### 5)Install all the packages listed in the slide running the following command:

```
$> conda install <package_name>
```

Example:

```
$>conda install tensorflow
```

## TensorFlow objects

- As any programming framework TensorFlow has objects and operations.

Math Operations	Source Operations	Tensor Objects
tf.add() tf.multiply() tf.subtract() tf.divide() tf.matmul()	tf.constant() tf.fill() tf.random_normal() tf.zeros() tf.truncated_normal()	tf.placeholder tf.variables

# TensorFlow and computational Graph

- Let us build one basic TensorFlow Graph

## 1) Define your graph

```
In [22]: with g.as_default():
...:     with tf.name_scope('add'):
...:         a = tf.constant(4, dtype=tf.float32, name='a')
...:         b = tf.constant(5, dtype=tf.float32, name='b')
...:     with tf.name_scope('multiply'):
...:         c = tf.constant(10, dtype=tf.float32, name='c')
...:     print("Namespace add constants names: {} {}".format(
...:         a.name, b.name))
...:     print("Namespace multiply constant name {}".format(
...:         c.name))
...:     s = a + b
...:     m = s * c
...:     with tf.Session() as sess:
...:         out = sess.run(m)
...:         print("Result: ",out)
```

## Tensorflow and hidden layers

- TensorFlow has higher level objects that can be used to build complex neural network Graph representations.

- Some of these higher level objects can be used to build different types of hidden layers: `tf.contrib.rnn`, `tf.nn.conv2d`, `tf.nn.maxpool`, `tf.nn.dropout`, etc.

## Tensorflow Linear regression and Logistic Regression

- To see examples of TensorFlow examples of Linear Regression and Logistic Regression open the Jupyter Notebook named: "TensorFlow\_Regression.ipynb"
- To open the notebook, once you activate your tensorflow conda environment just run:  
`$>jupyter notebook TensorFlow_Regression.ipynb`

**Linear Regression:** Is a way to model the linear relation between a depending variable and one or more independent variables.

**Logistic Regression:**

Logistic regression is a statistical method for analyzing a dataset in which there are one or more independent variables that determine an outcome. The outcome is measured with a dichotomous variable (in which there are only two possible outcomes)

# Tensorflow Natural Language Processing and Tensorflow

- Using TensorFlow and RNN LSTM we will predict the sentiment of the IMDB reviews.
- We will use an embedding layer to learn a mapping representation of each movie review, then we will feed the LSTM neural network from the embedding output.
- NLP problems steps:
  - Collect Data (feature – words – , labels – boolean –)
  - Normalization & Tokenized
  - Padding
  - Extract features (embedding)
  - Modeling (neural network)
- Once in your tensorflow conda environment open the Jupyter notebook called "Sentiment\_RNN.ipynb". You can do this running: "\$> jupyter notebook Sentiment\_RNN.ipynb"
- In the next slide we will see an LSTM cell internal gates representation.
